

PHP isset() Function

Topics : [PHP Functions](#)

Written on [May 14, 2021](#)

PHP `isset()` Function is used to check whether the variable is set or declared. Also checks a variable is empty. PHP `isset()` function is PHP built-in function.

PHP `isset()` Function checks variable is not NULL. PHP `isset()` Function also checks variable is set or not.

Syntax for `isset`:

```
isset(mixed $var, ...);
```

Parameter,

`$var` : Required. It specifies the variable to check.

`...` : Optional. Pass Multiple variable.

Return Values for `isset` :

PHP `isset()` function returns true if the variable exists and is not NULL, otherwise it returns false.

If multiple variables are passed, then this function will return true only if all of the variables are set.

Let's see below example to understand php `isset()` Function in details.

Example :

```
<?php
$var1 = 5;
// Returns true because $var is set because it doesn't have null value.
if (isset($var1)) {
    echo "<br> Variable 'var1' is set.";
}

$var2 = null;
// Returns false because $var2 is NULL.
if (isset($var2 )) {
    echo "<br>Variable 'var2 ' is set.";
}else
```

```
{  
echo "<br>Variable 'var2 ' is not set."  
}  
  
$var3 = 0;  
// Returns true because $var3 is not NULL.  
if (isset($var3 )) {  
echo "<br>Variable 'var3 ' is set."  
}  
?>
```
