

php code for inheritance

Topics : [PHP Programs](#)

Written on [December 13, 2022](#)

A extends keyword can be used for inheritance.

Example :

```
<?
class A
{
static $k=400;
function A()
{

$this->i=100;
self::$k=500;
}
function display()
{
echo "<br/>Inside parent class!!";
echo "<br/> parent class K: ".self::$k;
}
}

class B extends A
{
function show()
{
echo "<br/> from subclass k : ".parent::$k;
}
}

$objb = new B();

$objb->display();

echo "<br/> I :". $objb->i;
```

```
echo "<br/> k :".$obj->show();  
echo "<br/> Out side class K: ".A::$k;  
  
?>
```

Output :

```
Inside parent class!!  
parent class K: 500  
I :100  
from subclass k : 500  
k :  
Out side class K: 500
```
