

# Java For Each Loop

Topics : [JAVA](#)

Written on [February 14, 2023](#)

A "for-each" loop is used exclusively to loop through elements in an array.

**Syntax :**

```
for (datatype variableName : arrayName) {  
    // code block to be executed  
}
```

**Example :**

```
import java.util.*;  
  
public class Main {  
    public static void main(String[] args) {  
  
        String[] fruits = {"Apple", "Banana", "Grapes", "Orange"};  
        for (String p : fruits) {  
            System.out.println("A Fruit is : "+p);  
        }  
    }  
}
```

**Output :**

```
A Fruit is : Apple  
A Fruit is : Banana  
A Fruit is : Grapes  
A Fruit is : Orange
```
